

Locked Acceptance Criteria to 8-Stage Regulation Engine

Mapped to the Intake to Handoff & Evidence pain-point model

This supersedes the earlier build-plan mapping. The 19 locked ACs are mapped to the correct 8-stage regulation-management engine (Intake, Decomposition, Applicability, Impact Fan-Out, Exposure Quantification, Action Plan, Governance Decision, Handoff & Evidence) plus the cross-cutting Amendment Path. Three things fall out of doing this properly, flagged below rather than force-fit: a stage with no dedicated AC (gap), ACs that sit outside all 8 stages (scope extension), and a cross-stage dashboard layer that reads from multiple stages at once, consistent with the design rule that overlays sit on top of the engine rather than adding a new pipeline.

Legend:

Engine stage	Gap - no dedicated AC	Scope extension	<i>Stays-human tie-in</i>
--------------	-----------------------	-----------------	---------------------------

Section 1 — Locked Acceptance Criteria (19) — Unchanged

AC-01	Two regulation versions displayed, changed clauses identified and linked to the obligation each produces.
AC-02	Obligation approval requires explicit human sign-off, traceable to its source clause.
AC-03	Affected products are calculated; excluded products are explained with a stated reason.
AC-04	Product Compliance Snapshot created, with all readiness dimensions visible.
AC-05	Snapshot colours recalculate deterministically, including the 96%-complete-but-RED case.
AC-06	External execution shows a closed loop - request sent to PLM/Jira/ServiceNow and status returned.
AC-07	"Jira Done" does not automatically mean compliant - demonstrated live (CMP-103).
AC-08	Evidence lifecycle shows submit to verify to reject/resubmit, not only the happy path.
AC-09	Certification programme visible, certificate has structured coverage, gaps affect readiness.
AC-10	A non-compliant order is blocked, with a named blocking reason.
AC-11	Completing mandatory evidence releases the previously blocked order.
AC-12	A release token is generated only after all gates pass, and is immutable/auditable.
AC-13	The full regulatory-to-order digital thread is navigable, not a static diagram.
AC-14	Every decision carries owner, timestamp and reason code, visible in the UI.
AC-15	Control Tower shows RAG status across multiple products/BUs simultaneously, live.
AC-16	A second obligation/regulation can be added as configuration - no code change.
AC-17	A blocked order is framed against avoided cost/risk.
AC-18	A time-to-visibility comparison is stated.
AC-19	The demo can be reset reliably.

Section 2 — Mapped to the 8-Stage Regulation Engine

Source: Regulation Management Pain Points & AI Impact deck. Stage order: Intake, Decomposition, Applicability, Impact Fan-Out, Exposure Quantification, Action Plan, Governance Decision, Handoff & Evidence, plus the cross-cutting Amendment Path.

STAGE 1 - Intake

Pain point: Signals scattered across email, portals, bulletins; easy to miss or catch late.

Gap: No locked AC targets Intake directly - it is upstream of where the 19 ACs start (they assume a regulation is already in the system). Not a defect for this POC, but worth naming if Intake monitoring is ever demoed as a claim.

STAGE 2 - Decomposition

Pain point: Long legal text broken into actionable clauses ad hoc, once, by one SME.

AC-01 Regulation versions displayed, clauses identified and linked to the obligation each produces.

AC-02 Obligation approval requires explicit human sign-off, traceable to source clause.

Stays human (per source deck): "SME validates ambiguous clauses" - directly satisfied by AC-02's human-sign-off requirement.

STAGE 3 - Applicability

Pain point: SME-by-SME consultation; judgment never recorded reusably.

AC-03 Affected products calculated; excluded products explained with a stated reason.

Stays human (per source deck): "Applicability Rulings - SME always decides" - AC-03's exclusion reasoning is exactly this judgment made visible and recorded, not the AI silently deciding.

STAGE 4 - Impact Fan-Out

Pain point: Manual BOM/system traversal; each function re-learns the regulation cold.

Stays human (per source deck): "Cross-functional trade-off negotiation stays a meeting" - correctly not represented by any AC; the meeting itself is out of platform scope by design.

Gap: No AC beyond AC-03's product list (Stage 3) models the fan-out itself as a distinct object. The "prescoped brief" the source deck describes is effectively delivered by the Change Register (see Stage 6) rather than a dedicated Impact Fan-Out screen.

STAGE 5 - Exposure Quantification

Pain point: Estimated informally, inconsistently, often skipped under pressure.

AC-17 Blocked order is framed against avoided cost/risk (closest proxy - see gap note).

Stays human (per source deck): "Final materiality judgment stays human" - consistent with AC-17 being framing/narrative rather than an automated score.

Gap: AC-17 is a demo narrative line prepared in the rehearsal step, not a built screen, field, or data object. This stage has no dedicated Regulus artifact. If Exposure Quantification is meant to be demoed as a capability (not just narrated), it needs its own AC and build task - currently it doesn't have one.

STAGE 6 - Action Plan

Pain point: Built per-function in spreadsheets, rarely linked back to source clause.

AC-06 External execution shows a closed loop - request sent and status returned (PLM/Jira/ServiceNow).

AC-07 "Jira Done" does not automatically mean compliant - demonstrated live (CMP-103).

Stays human (per source deck): "Resourcing trade-offs vs other priorities" - not modelled by any AC, correctly left to humans.

STAGE 7 - Governance Decision

Pain point: Scattered across meetings, emails, decks; no single retrievable record.

AC-12 Release token generated only after all gates pass - itself a governance gate.

AC-14 Every decision carries owner, timestamp and reason code, visible in the UI.

Stays human (per source deck): "Governance Approval - every gate is a named human, permanently" - this is precisely what AC-14 builds. Strong alignment: same control boundary, nearly the same wording.

STAGE 8 - Handoff & Evidence

Pain point: Evidence lives in inboxes/drives; audit readiness = manual reconstruction.

AC-08 Evidence lifecycle shows submit to verify to reject/resubmit.

AC-09 Certification programme visible, certificate structured coverage, gaps affect readiness.

AC-13 Full regulatory-to-order digital thread is navigable - the "one click" audit reconstruction.

Stays human (per source deck): "Evidence Sufficiency (borderline cases) - human rules on adequacy" - directly satisfied by AC-08's reject/resubmit path requiring a human decision on borderline evidence.

STAGE Amendment Path - (cross-cutting)

Pain point: Amendments missed, or the full process restarted from scratch.

AC-01 Version-to-version clause diff is the Amendment Path in miniature (see also Stage 2).

AC-16 Second obligation/regulation added as configuration - proves the same engine handles amendments without new code, matching the deck's "Same Engine, Swapped Config" claim.

Stays human (per source deck): "Closing/reopening work is never auto-executed" - implicitly covered by the Change Requirement lifecycle's Blocked/Rejected/Exception states, but not demonstrated as an explicit amendment-reopen case. Minor: worth a one-line callout in the script rather than a new build task.

Cross-Stage Dashboard Layer (reads across Stages 2-8)

Per the source deck's own design rule - "every WOW factor is a layer over the existing flow, no added surface to break live" - the following ACs are not stage-specific. They read outputs that stages 2-8 already produce and roll them up into a single live view.

STAGE Dashboard - Snapshot & Control Tower	
<i>Pain point:</i> Not a pain point in the source deck - this is the synthesis layer.	
AC-04	Product Compliance Snapshot created, with all readiness dimensions visible.
AC-05	Snapshot colours recalculate deterministically, incl. the 96%-complete-but-RED case.
AC-15	Control Tower shows RAG status across multiple products/BUs simultaneously, live.
<i>Consistent with the source deck's WOW-factor pattern (e.g. Regulatory Horizon, AI Divergence Dashboard) - both read existing records rather than adding a new pipeline path.</i>	

Beyond Stage 8 - Enforcement / Release (not covered by the 8-stage model)

STAGE 9 (proposed) - Enforcement / Release	
<i>Pain point:</i> Not a pain point in the source deck - the deck's 8 stages end at audit-readiness, not manufacturing execution.	
AC-10	A non-compliant order is blocked, with a named blocking reason.
AC-11	Completing mandatory evidence releases the previously blocked order.
Scope extension: AC-10 and AC-11 sit outside all 8 stages by design - the source deck's pain points stop at "Handoff & Evidence" (getting audit-ready), while Regulus additionally blocks physical order release. This is a genuine capability beyond the deck's stated scope, not a mapping gap. Recommend naming it explicitly as a 9th stage or a distinct "Enforcement" layer in future decks, rather than folding it silently into Handoff & Evidence - the jury may otherwise ask why the demo does more than the pain-point deck promised.	

Narrative-Only Ties (used in script, not stage-mapped)

AC-18	Time-to-visibility comparison is stated in the demo script, sourced directly from the source deck's own "Current Effort" vs "With AI-Assisted Platform" columns (e.g. Stage 3: 3-5 days to minutes). No new claim to defend - reuse the deck's own numbers.
AC-19	Demo resets reliably - operational, not stage-mapped.

Section 3 — Findings From Remapping to the 8-Stage Engine

Stage 5, Exposure Quantification	Gap	No dedicated AC. AC-17 is narrative only, prepared during rehearsal, not a built artifact. Decide: acceptable gap for this POC, or add a dedicated exposure field/screen.
Stage 4, Impact Fan-Out	Minor gap	No distinct fan-out object; the “prescoped brief” is delivered via the Stage-6 Change Register instead. Likely fine, but not a literal Stage 4 artifact.
Order blocking (AC-10, AC-11, AC-12)	Scope extension	Sits beyond all 8 stages - the source deck stops at audit-readiness (Stage 8), Regulus also enforces at the order level. Recommend naming this explicitly as “Stage 9: Enforcement” in decks, rather than letting the jury assume it's covered by Stage 8.
Snapshot & Control Tower (AC-04, AC-05, AC-15)	Cross-stage layer	Correctly not stage-specific - matches the source deck's own WOW-factor design rule (overlay, no new pipeline path).
Stays-human alignment	Consistency check - passed	AC-02, AC-03, AC-08 and AC-14 each map cleanly onto one of the source deck's five named “stays human” boundaries. The two documents reinforce rather than contradict each other.
AC-16 vs “Same Engine, Swapped Config”	Reinforcement	AC-16's config-not-code requirement is the same claim as the portability beat's live demo - worth demoing together rather than as separate moments.

Net: 16 of 19 ACs map cleanly onto the 8-stage engine or its cross-cutting Amendment Path and dashboard layer. Two (AC-10, AC-11) are a deliberate scope extension beyond the deck's own model and should be named as such rather than mapped silently. One (AC-17, Stage 5) is currently narrative-only and is the single clearest “build it or cut it” decision left open.
